Alignment of ISBD element set with FRBR element set..... 6

Introduction

The International Standard Bibliographic Description (ISBD)¹ is a standard that was created and is maintained by the International Federation of Library Associations and Institutions (IFLA), intended to serve as the principal standard to promote universal bibliographic control, that is, to make universally and promptly available, in a form that is internationally acceptable, basic bibliographic data for all published resources in all countries.

The ISBD specifies the requirements for the description and identification of published resources that are likely to appear in library collections. The primary purpose of the ISBD is to provide the stipulations for compatible descriptive cataloguing worldwide in order to aid the international exchange of bibliographic records between national bibliographic agencies and throughout the international library and information community. The ISBD provides stipulations to cover the maximum amount of descriptive information that may be required in a range of different bibliographic activities. It therefore includes elements that are essential to one or more of those activities, but not necessarily to all.

The Functional Requirements for Bibliographic Records (FRBR)² is a conceptual reference model that was also created and is maintained by IFLA, with the aim to provide a framework for relating the data that are recorded in bibliographic records to the needs of users of those records and for assessing their actual relevance.

FRBR is based on an entity analysis technique that is used in the development of conceptual models for relational database systems, and also depicts the relationships that normally hold between one type of entity and another type of entity; thus it may serve as a reference point for testing the validity and robustness of extant data models and data structures. It can therefore be used to improve extant formats as well as to provide guidance for the process of developing new formats. It also can be extremely valuable in helping design OPACs.

In order to enable the use of ISBD data as Linked Open Data³ (LOD), and to enhance developments of Semantic Web bibliographic tools and services, the representation of the ISBD Consolidated edition has been published in the Open Metadata Registry⁴ (OMR)⁵ as a registration of classes and properties, following the World Wide Web Consortium (W3C) Resource Description Framework⁶ (RDF) standard. The FRBR element set, as amended and corrected through February 2009, has as well been published in the OMR.⁷

This document consists in a table containing the alignment of the ISBD element set with the FRBR element set, applying the methodology used for the *Alignment of the ISBD: International Standard Bibliographic Description element set with RDA: Resource Description & Access element set Version 3.1(17 February 2015)* by Gordon Dunsire and IFLA Cataloguing Section's ISBD Review Group.⁸

The first aim of this alignment is to keep the consistency between IFLA standards and this would need to be updated when any of them is revised. The second aim is to help the ISBD Review Group in the work of the future revision of the ISBD.

The ISBD element set is published in the consolidated edition of the ISBD (pp. 14-17), while the definitions in the table for ISBD elements are taken from the OMR. These definitions have been approved by the ISBD Review Group, and derive from the ISBD Glossary and the ISBD text. The scope notes of ISBD elements in the OMR have been taken into account in the alignment, but are excluded here for brevity. The FRBR element set and definitions are taken from the native RDF classes and properties described in the current text (February 2009) of the Functional Requirements for Bibliographic Records (FRBR) entity-relationship model, which is synchronized with the OMR.

Information used to determine the alignments is taken, in order of priority, from:

1. Definitions
2. Scope notes
3. Other text in the documentation
4. Examples in the documentation

The alignment shows that:

- There are elements lacking in one or the other content standard.
- The definitions of elements with the same label can be broader or the same irrespective of the standard.

The alignments given are not formal or operational mappings from ISBD elements to FRBR elements. Instead, they are intended to support a variety of maps for different applications. For example, a specific application may choose to treat the three categories of alignment (broader, narrower, equal) as a single mapping type (approximately equal, or equivalent, etc.).

One development of this alignment may be to implement a map for the RDF (Resource Description Framework) representations of the *ISBD element set* and the *FRBRer element set* in the *Open Metadata Registry*⁹ (OMR), using the RDF Schema property “subPropertyOf” for narrower and broader alignments, applying the same methodology used for the maps between ISBD properties and RDA properties published in the RDA registry.¹⁰

Note that parallel elements in ISBD have the same alignment as the corresponding element; Parallel title, being in fact parallel to Title proper has the same alignment of the latter.

Note: The direction of this alignment is **from ISBD to FRBR only**.

Alignment indicators

<	ISBD element is narrower in definition and scope than FRBR element
>	ISBD element is broader in definition and scope than FRBR element
=	ISBD element is the same in definition and scope as FRBR element
n/a	There is no alignment between ISBD and FRBR elements
